User Lifecycle Management

Joiner, Mover and Leaver control-testing report

Asterbridge Care Technologies Inc. | Fictional organization / real isolated lab execution

Assessment date: 12 October 2026 • Version: 1.0 • Classification: Public lab portfolio

1 Executive summary

This working paper records a completed Active Directory joiner–mover–leaver (JML) exercise for Olivia Bennett (LAB-JML-001), a synthetic front-desk employee. Three PowerShell scripts were executed in an isolated Windows Server 2022 domain lab and access effects were observed on a domain-joined Windows 10 Pro workstation.

The joiner created and enabled Olivia in Clinical Operations with baseline and Hamilton Front Desk group memberships. The mover removed Hamilton membership, added Kitchener membership, updated the Office attribute and was followed by successful positive and negative file-access tests. The leaver disabled the account, removed both tested access assignments, moved the account to Disabled Users, and a fresh Windows sign-in was rejected with an account-disabled message.

Conclusion: The defined lab scenarios met their observed acceptance criteria. This is not evidence that a fictional production organization has an operational JML control across all applications or identity providers.

2 Scope and test boundary

Element	Test scope
Directory and domain	AD DS domain mydomain.com on the Windows Server VM (VirtualBox machine Asterbridge-DC01; Windows hostname DC).
Workstation	Domain-joined Windows 10 Pro VM (VirtualBox machine Asterbridge-WS01; Windows hostname CLIENT1).
Test identity	Olivia Bennett / obennett / LAB-JML-001; fictional additional lab employee.
Test access	Corporate AllStaff and clinic FrontDesk security groups; NTFS folders on the test workstation.
Excluded	Entra ID, Okta, application-level patient records, HR approvals, live sessions across cloud systems, production SLAs.

3 Design and expected control behavior

The exercise maps to Asterbridge control IAM-02 (timely provisioning and removal) and supporting access-governance considerations under IAM-03. The foundation casebook describes HR-initiated identity events and evidence expectations; for this lab, the approval events are fictional assumptions, not independently produced tickets.

Stage	Expected state
Joiner	Enabled account; Domain Users + GRP-CORP-AllStaff + GRP-CLINIC-HAM-FrontDesk. Hamilton write/read allowed; Kitchener write denied.
Mover	Office = Kitchener Clinic; Hamilton group removed; Kitchener group added; corporate group retained. Access reverses after a new sign-in.
Leaver	Disabled account; Asterbridge role groups removed; account in

	Disabled Users OU; fresh online Windows sign-in rejected.

4 Observed test results

Test ID	Test / method	Observed outcome	Result
JML-T01	Run New-AsterbridgeJoiner.ps1	Provisioning success; account enabled; Hamilton + corporate groups present.	Pass
JML-T02	Log on and test before transfer	Hamilton file write/read succeeded; Kitchener write denied.	Pass
JML-T03	Run Move-AsterbridgeEmployee.ps1	Office changed; Hamilton group removed; Kitchener group added.	Pass
JML-T04	New logon, test after transfer	Kitchener write/read succeeded; Hamilton write and prior-file read denied.	Pass
JML-T05	Run Remove-AsterbridgeLeaver.ps1	Account disabled, Asterbridge group memberships removed, moved to Disabled Users OU.	Pass
JML-T06	Attempt fresh sign-in after offboarding	Windows stated account was disabled and rejected sign-in.	Pass

All six defined test points passed based on user-provided screenshots and the performed lab steps. The evidence package contains cropped excerpts of those screenshots; original screenshots remain available in the conversation history.

5 Exceptions, observations and limitations

- Joiner failure handling is incomplete: the script attempts to disable an account after an error, but it does not automatically remove partially granted group memberships or generate a durable audit log.
- Mover automation is bound to this test account and does not implement automatic rollback of partial changes. It is a scenario script, not a general HR-provisioning integration.
- Leaver automation revokes selected AD groups, but does not automatically terminate cloud sessions, remove application-specific privileges, disable local cached logons or reconcile every possible entitlement.
- An earlier offboarding attempt reported an Employee ID mismatch and did not complete; its cause was not independently established. A later elevated run completed and subsequent verification showed the expected account state. Do not attribute the mismatch to lack of elevation without further evidence.
- Olivia was observed in a Windows session after directory disabling, and a credential reminder appeared. Subsequent checks showed the workstation could discover the DC and reach LDAP port 389. A later explicit fresh sign-in was rejected. The initial session behavior is not fully explained by the available evidence.
- No timed deprovisioning SLA, managerial approvals, event log 4625/4768 correlation, endpoint session termination or cloud deprovisioning was tested.

6 GRC control considerations

Reference	How this lab relates	Limit
Asterbridge IAM-02	Directory provisioning, movement and revocation of a lab employee account.	No fictional HR ticket or timing population sample.
Asterbridge IAM-03	Demonstrates correction of role accumulation during one transfer.	No quarterly privileged-access certification.
NIST CSF 2.0 PR.AA	Identity management, authentication and authorization control outcomes.	Illustrative mapping; not a CSF assessment.
ISO/IEC 27001:2022 Annex A	A.5.16 Identity management; A.5.18 Access rights.	Practice example; not ISMS conformance.

SOC 2 CC6 logical access	Relevant to provisioning and revoking access.	Not an SOC 2 audit or operating-effectiveness opinion.

7 Evidence register

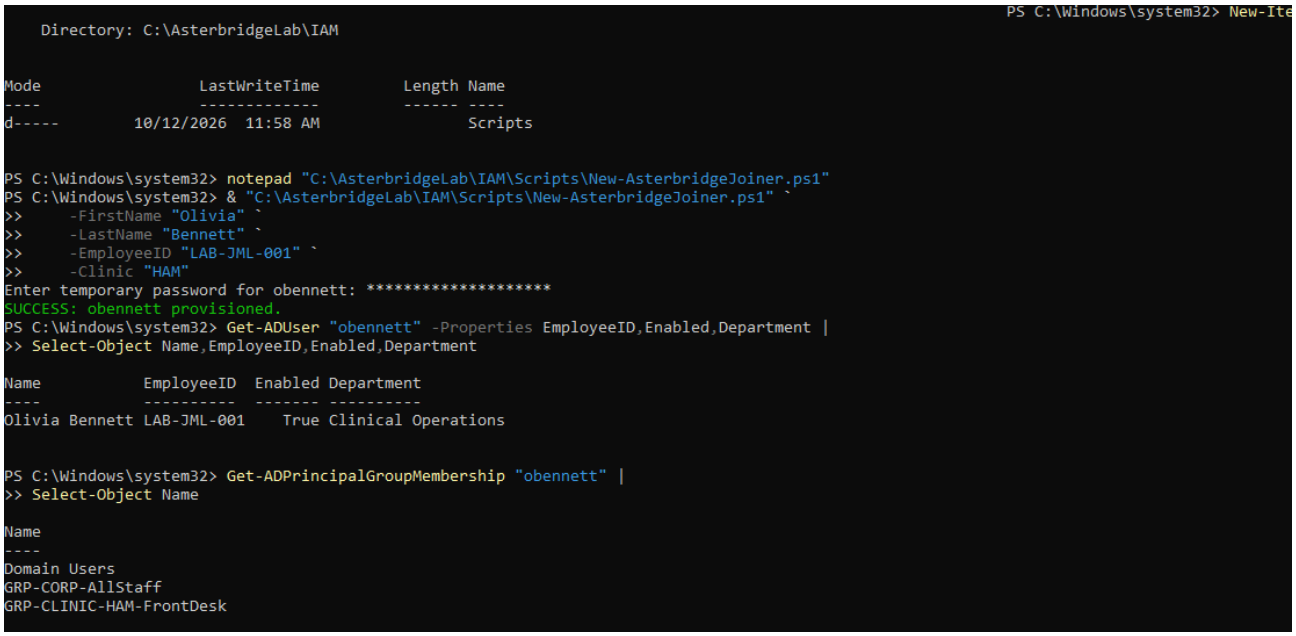

Ref	Evidence description	Supports
JML-E01	Joiner execution, enabled account, Hamilton/corporate memberships	JML-T01
JML-E02	Before-transfer identity, groups and positive/negative access	JML-T02
JML-E03	Mover execution and corrected AD groups/Office attribute	JML-T03
JML-E04	After-transfer Kitchener success; Hamilton denial	JML-T04
JML-E05	Offboarding status, OU and remaining Domain Users group	JML-T05
JML-E06	DC discovery and LDAP reachability check	Context only
JML-E07	Fresh Windows sign-in explicitly rejected: account disabled	JML-T06

Evidence type: lab-observed screenshots (cropped for readability) with fictitious identity data. All displayed passwords are masked or absent. Evidence is not a production identity export.

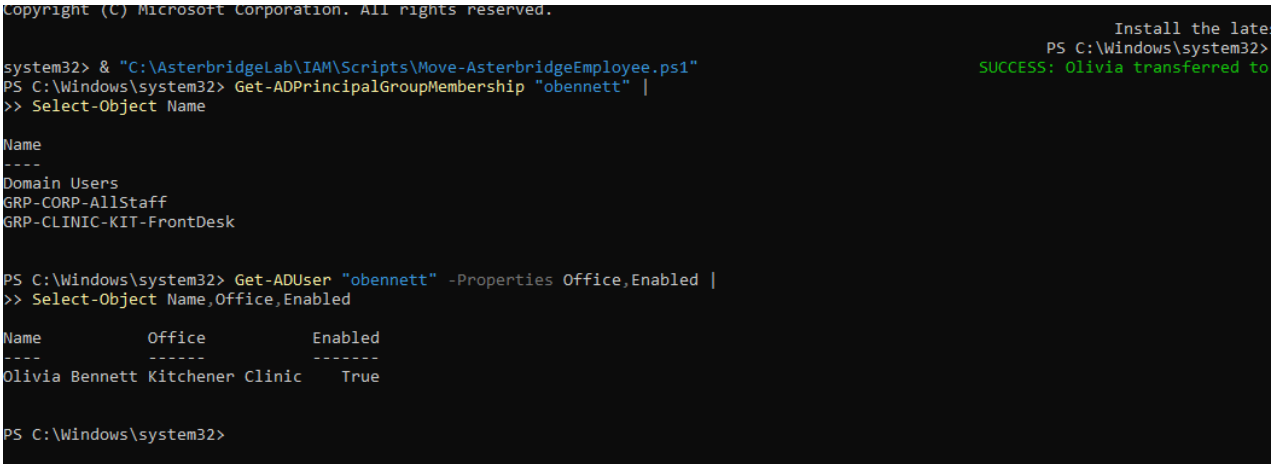

8 Recommendations / next iteration

- Keep the original scripts as tested. Add a separately identified v2 with parameter validation, explicit requested/approved group inputs and preview or confirmation mode.
- Use structured execution logs with correlation IDs, timestamped change events, before/after memberships, script version and operator identity.
- Implement safe rollback or a transaction-style recovery procedure for partial mover and joiner failures.
- Expand leaver testing to active sessions, cached sign-in behavior, session revocation, application and cloud identity entitlements; reconcile against an HR roster.
- Use sample tickets for the three events and measure disable time against the casebook's defined target before claiming control effectiveness.

Appendix A Selected execution evidence

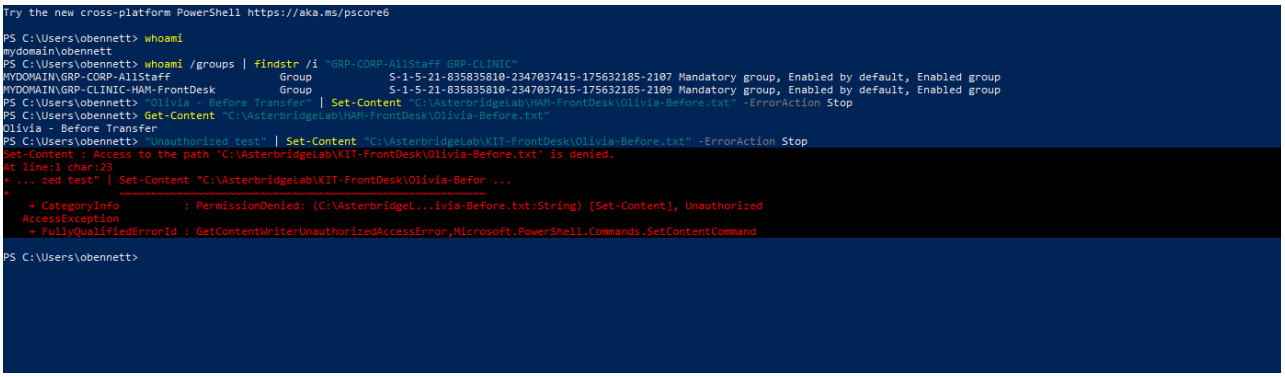

JML-E01 — Joiner script execution and initial AD account verification.

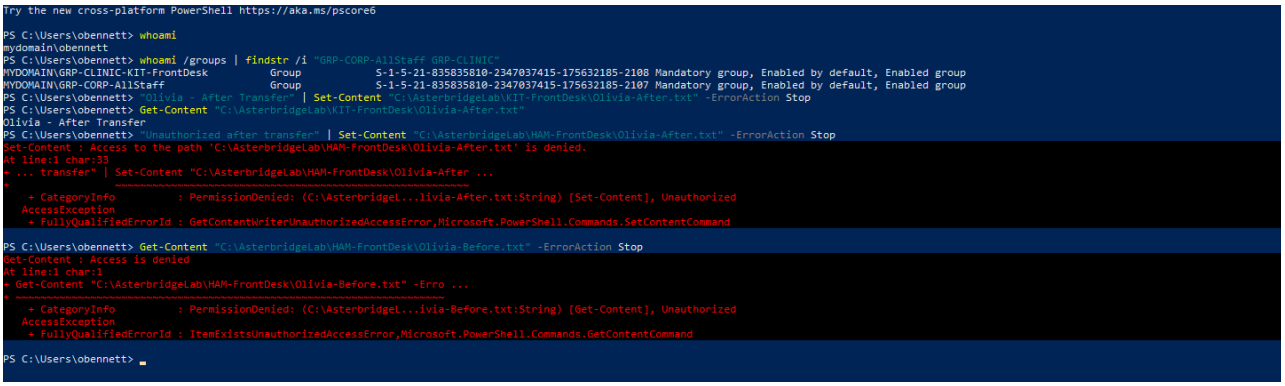

JML-E03 — Directory memberships and office after transfer.

Appendix B Access tests

JML-E02 — Hamilton allowed; Kitchener denied before transfer.

JML-E04 — Kitchener allowed; Hamilton write/read denied afterward.

Appendix C Offboarding checks
